Conjoint Problem

Geometric explanation

$(x_1, x_2)$  = Coordinates of the Ideal point

$(y_{11}, y_{12})$  = Coordinates of  $O_1$

$d_1$  = Distance b/w  $O_1$  and ideal point

If  $d_1 < d_2$

then  $O_1$  have more preference than  $O_2$ .

WEEK 20  
130-235

The logic

- A methodology for analyzing individual differences in preference judgements with regard to a set of options.
- The product options are represented as points in a multi-attribute space.
- Different <sup>subject</sup> consumers correspond to different "ideal points" that denote their "most preferred" location.
- Given two options, the customer is supposed to prefer that option which is "closer" to his/her ideal point.
- As a measure of distance, normally either the Euclidean metric or the weighted Euclidean metric is used.

## Illustrative example

	Attribute 1	Attribute 2
Product 1	1.5	12
Product 2	10	8
Product 3	2.3	4
Product 4	1	7

Diagram illustrating the relationship between the products and their attribute values:

- Product 3 is associated with Attribute 1 value 2.3 and Attribute 2 value 4. A red circle highlights the value 2.3, and a red arrow points from it to the label  $y_{31}$ .
- Product 3 is also associated with Attribute 2 value 4. A red circle highlights the value 4, and a red arrow points from it to the label  $y_{32}$ .

(2, 4)	2	4
(3, 4)	4	3

11

Linear programming model using pairwise judgements:Notations

- 1 • Set of options on which the preference judgement is made:  $j = \{1, 2, \dots, n\}$ .
- 2 • The  $n$  options are described in terms of  $t$  dimension  $P = \{1, 2, \dots, t\}$
- 3 • The pre-specified location of the  $j^{\text{th}}$  option in the  $t$ -dimensional space is denoted by  $y_j$ . That is  $y_j = \{y_{j,p}\}_{p \in P}$ .
- 4 • The ideal point of the subject is  $x = \{x_p\}_{p \in P}$ , that is, the product location most preferred by the individual. ( $x_p$  can be positive, negative, or zero).
- 5 • The ideal point of the subject is  $x = \{x_p\}_{p \in P}$ , that is, the product location most preferred by the individual. ( $x_p$  can be positive, negative, or zero).

THURSDAY

MAY 2022

12

WEEK 20  
132-233Problem Specific notations

- We have four variants to be compared:  $n=4$ ,  $j=1, 2, 3, 4$ .
- The  $4(n=4)$  options are described on 2 dimensions,  $t=2$ ,  $P=\{1, 2\}$ ,
- Specified location of the  $j^{\text{th}}$  option in the  $d$ -dimensional space is denoted by  $y_j$ . This has two coordinates;  $y_j = \{y_{j1}, y_{j2}\}$ . We have  $y_1, y_2, y_3, y_4$ .

$$\begin{aligned} y_1 &= (y_{11}, y_{12}) \\ y_2 &= (y_{21}, y_{22}) \end{aligned}$$

- Ideal point for this consumer is  $X = \{x_1, x_2\}$

17	18	19	20	21	22	23
24	25	26	27	28	29	30

### LP model using pairwise judgements: Notations

- Then the unweighted and weighted distance of the  $j^{\text{th}}$  option from the ideal point, respectively, is given by:

$$d_j^u = \left[ \sum_{p \in P} (y_{j,p} - x_p)^2 \right]^{1/2}, \forall j \in J$$

$$d_j^w = \left[ \sum_{p \in P} w_p (y_{j,p} - x_p)^2 \right]^{1/2}, \forall j \in J$$

→ Weighted distance

- Weights are non-negative for all the attributes ( $w_p \geq 0$ )
- Moreover, the squared distance is  $s_j = (d_j^w)^2$ .
- Let  $\Omega = \{(j,k) \}$  denote the set of ordered pairs  $(j,k)$  where  $j$  designates the preferred product on a forced choice basis resulting from a paired comparison involving  $j$  and  $k$ .
- In this set-up, the only variables are weights  $(w_p)$  and the ideal point  $(x_p)$ . All the others are parameters and are known a priori.
- Any optimization problem for which  $(w, x)$  is the

124-231

solution, will satisfy the (distance) inequality:

$$S_K \geq S_j$$

- Given option locations  $Y_j = \{y_{j,p}\}$  and the set of ordered pairs  $\Pi$ , determine the solution  $(w, x)$  such that
  - (a) weights are non-negative and
  - (b) distance inequality is violated as less as possible.
- The objective function can be formulated as a minimization. And the objective function can be defined as the "poorness of fit".

$$\beta = \text{poorness of fit} = \sum_{(j,k) \in \Pi} (s_j - s_k)^+$$

$$(x)^+ = \max(0, x)$$

$$x = -2 \Rightarrow x^+ = 0$$

$$x = 2 \Rightarrow x^+ = 2$$

$$(s_j - s_k)^+ = \max(0, |s_j - s_k|)$$

SUNDAY

15

Goodness of fit - Poorness of fit = constant (h)

17	18	19	20	21	22	23
24	25	26	27	28	29	30

JUNE

### Introduction :-

- A traditional conjoint analysis is really just a multiple regression problem.
- The respondent's rating for the product concepts form the dependent variable.
- The characteristic of the product (the attribute levels) are the independent (predictor) variables.
- The estimated betas associated with the independent variables are the utilities (preference score) for the levels.
- The R-Square for the regression characterizes the internal consistency of the respondents.

### Example

Consumer choice process for a cell phone purchase  
Three attributes - Brand, Battery Size and the Camera resolution.

- We have three brands to choose from; two options for battery, and three choices for the camera resolution.
- We assume that this is a full-factorial design, therefore, the respondent (customer, buyer) is shown all the 18 combinations available. And they provide preference ratings for each of these combination.

# Regression Method for Conjoint Analysis

2022 APRIL

25

WEDNESDAY  
2022 MAY

S	M	T	W	T	F	S
3	4	5	6	7	8	9
10	11	12	13	14	15	16
17	18	19	20	21	22	23
24	25	26	27	28	29	30

WEEK 22  
145-220

## Example: Regression Statistics

- The regression equation is:

$$Y = 7.334$$

Intercept  
(coefficients)

VIVO (coefficient)

X10M1 (coefficient)

$$Y = 7.334 + 1.167 \times \text{VIVO} + 1.83 \times \text{X10M1} +$$

$$\beta_0 + \beta_1 x_1 + \beta_2 x_2 +$$

$$2.2334 \times (6000 \text{ mAh}) + 4.83 \times (20 \text{ MP}) + 2.16 \times (13 \text{ MB})$$

$$\beta_3 x_3 + \beta_4 x_4 + \beta_5 x_5$$

- The regression coefficients are called "part-worth".
- The regression is significant.
- Each of the explanatory variables is significant.

## Partworths

- These are the level utilities for the attributes.
- The total worth of the product (option) is calculated from multiple attributes and multiple levels of attributes together.
- Utilities values for the separate parts of the product (assigned to the attributes) are the part worths.
- Partworth for each level of each attribute:

Brand/Manufacturer	Battery		
	4500 mAh	6000 mAh	Good mAh
Samsung	0	1.167	2.334
VIVO			
X10M1
